Guidelines for the management of atrial fibrillation

The Task Force for the Management of Atrial Fibrillation of the European Society of Cardiology (ESC)

An irregular pulse should always raise the suspicion of AF, but an ECG recording is necessary to diagnose AF. Any arrhythmia that has the ECG characteristics of AF and lasts sufficiently long for a 12-lead ECG to be recorded, or at least 30 s on a rhythm strip, should be considered as AF.^{3,31} The heart rate in AF can be calculated from a standard 12-lead ECG by multiplying the number of

holter ECG recommandé pour détecter FAP

Available non-continuous ECG methods include scheduled or symptom-activated standard ECGs, Holter (24 h to 7 days) monitoring and transtelephonic recordings, patient- and automatically activated devices, and external loop recorders. If AF is present at the time of recording, use of the standard 12-lead ECG is sufficient to confirm the diagnosis. In paroxysmal AF, prolonged non-continuous recording will facilitate AF detection. It has been estimated that 7 day Holter ECG recording or daily and symptom-activated event recordings may document the arrhythmia in ~70% of AF patients, and that their negative predictive value for the absence of AF is between 30 and 50%.³ In stroke survivors, a step-wise addition of five daily short-term ECGs, one 24 h Holter ECG, and another 7 day Holter ECG will each increase the detection rate of AF by a similar extent.³⁴

Guidelines for the Prevention of Stroke in Patients With Stroke and Transient Ischemic Attack: A Guideline for Healthcare Professionals From the American Heart Association/American Stroke Association

AF

For patients who have experienced an acute ischemic stroke or TIA with no other apparent cause, prolonged rhythm monitoring (\approx 30 days) for AF is reasonable within 6 months of the index event (Class IIa; Level of Evidence C).

New recommendation

Different Devices

The longer you monitor the patient, the more likely you are to detect AF.
It depends also on the type of monitoring device
(patient-trigger record, autotriggered device, both)

Cryptogenic Stroke Patients With AF Detected by Various Monitoring Methods

Figure 2. Yield of various external monitors for the detection of AF following cryptogenic stroke. AF = atrial fibrillation.

- Non invasive device

- ✓ ECG
- ✓ 48 h Telemetry
- ✓ 24h holter ECG
- ✓ Loop-recording monitors
 - with memory (R test)
 - without memory (cardiatel[®])
- ✓ MCOT

- Invasive

- ✓ Implantable cardiac monitor reveal xt[®].

Différents dispositifs non implantables pour détecter la FAP

- ECG, Cardiatel (enregistrement d'un ecg par un appareil spécial qui transmet à un centre cardiatel de lecture)
- Holter ECG de 24h-48h: enregistrement continu de ECG
- Holter longue durée jusqu'à 4 sem: enregistrement continu
- R test, loop recorder, ZIO patch: enregistrement événementiel uniquement, enregistrement de boucles de qq min, déclenché par le patient et par des critères de tachycardie...transmission ecg par téléphone, tracé par mail au cardio directement...
- Cardionet MCOT: 3 électrodes, boîtier, événementiel, ECG transmis à un centre d'analyse spécial

Inconvénients

- peut louper des événements car faut bien paramétrer l'appareil
- manque début ou fin de l'épisode,
- difficile d'estimer la durée de l'épisode d'arythmie

spider flash: holter ECG longue durée

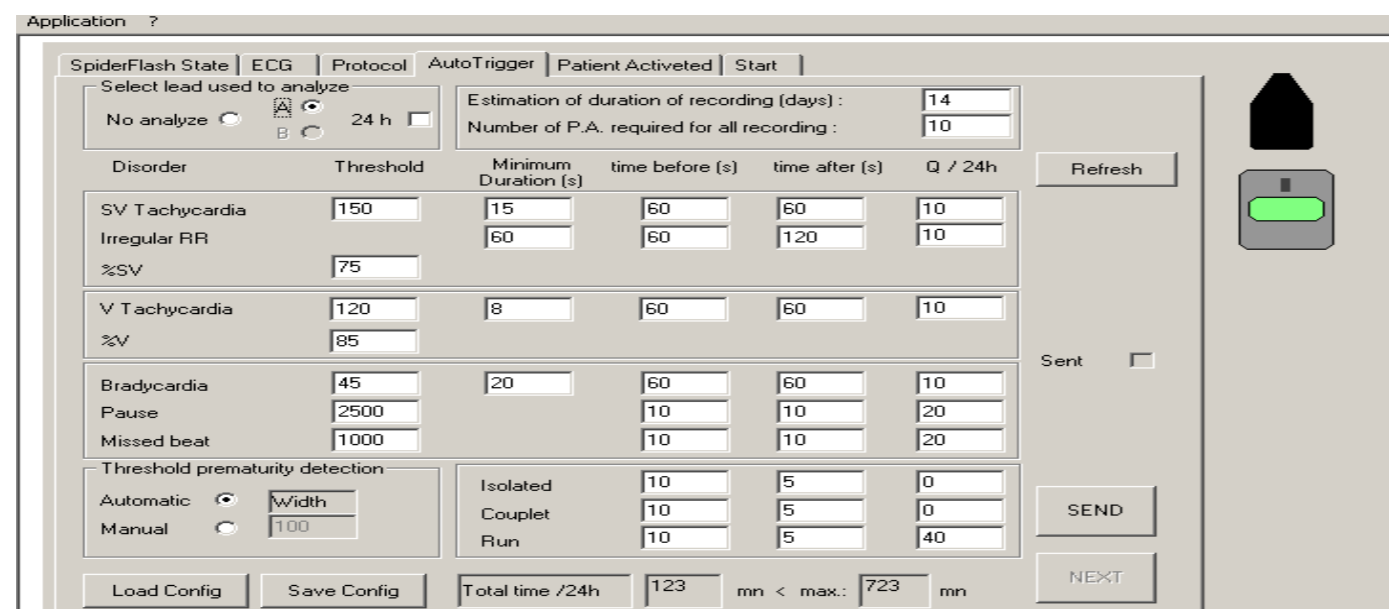

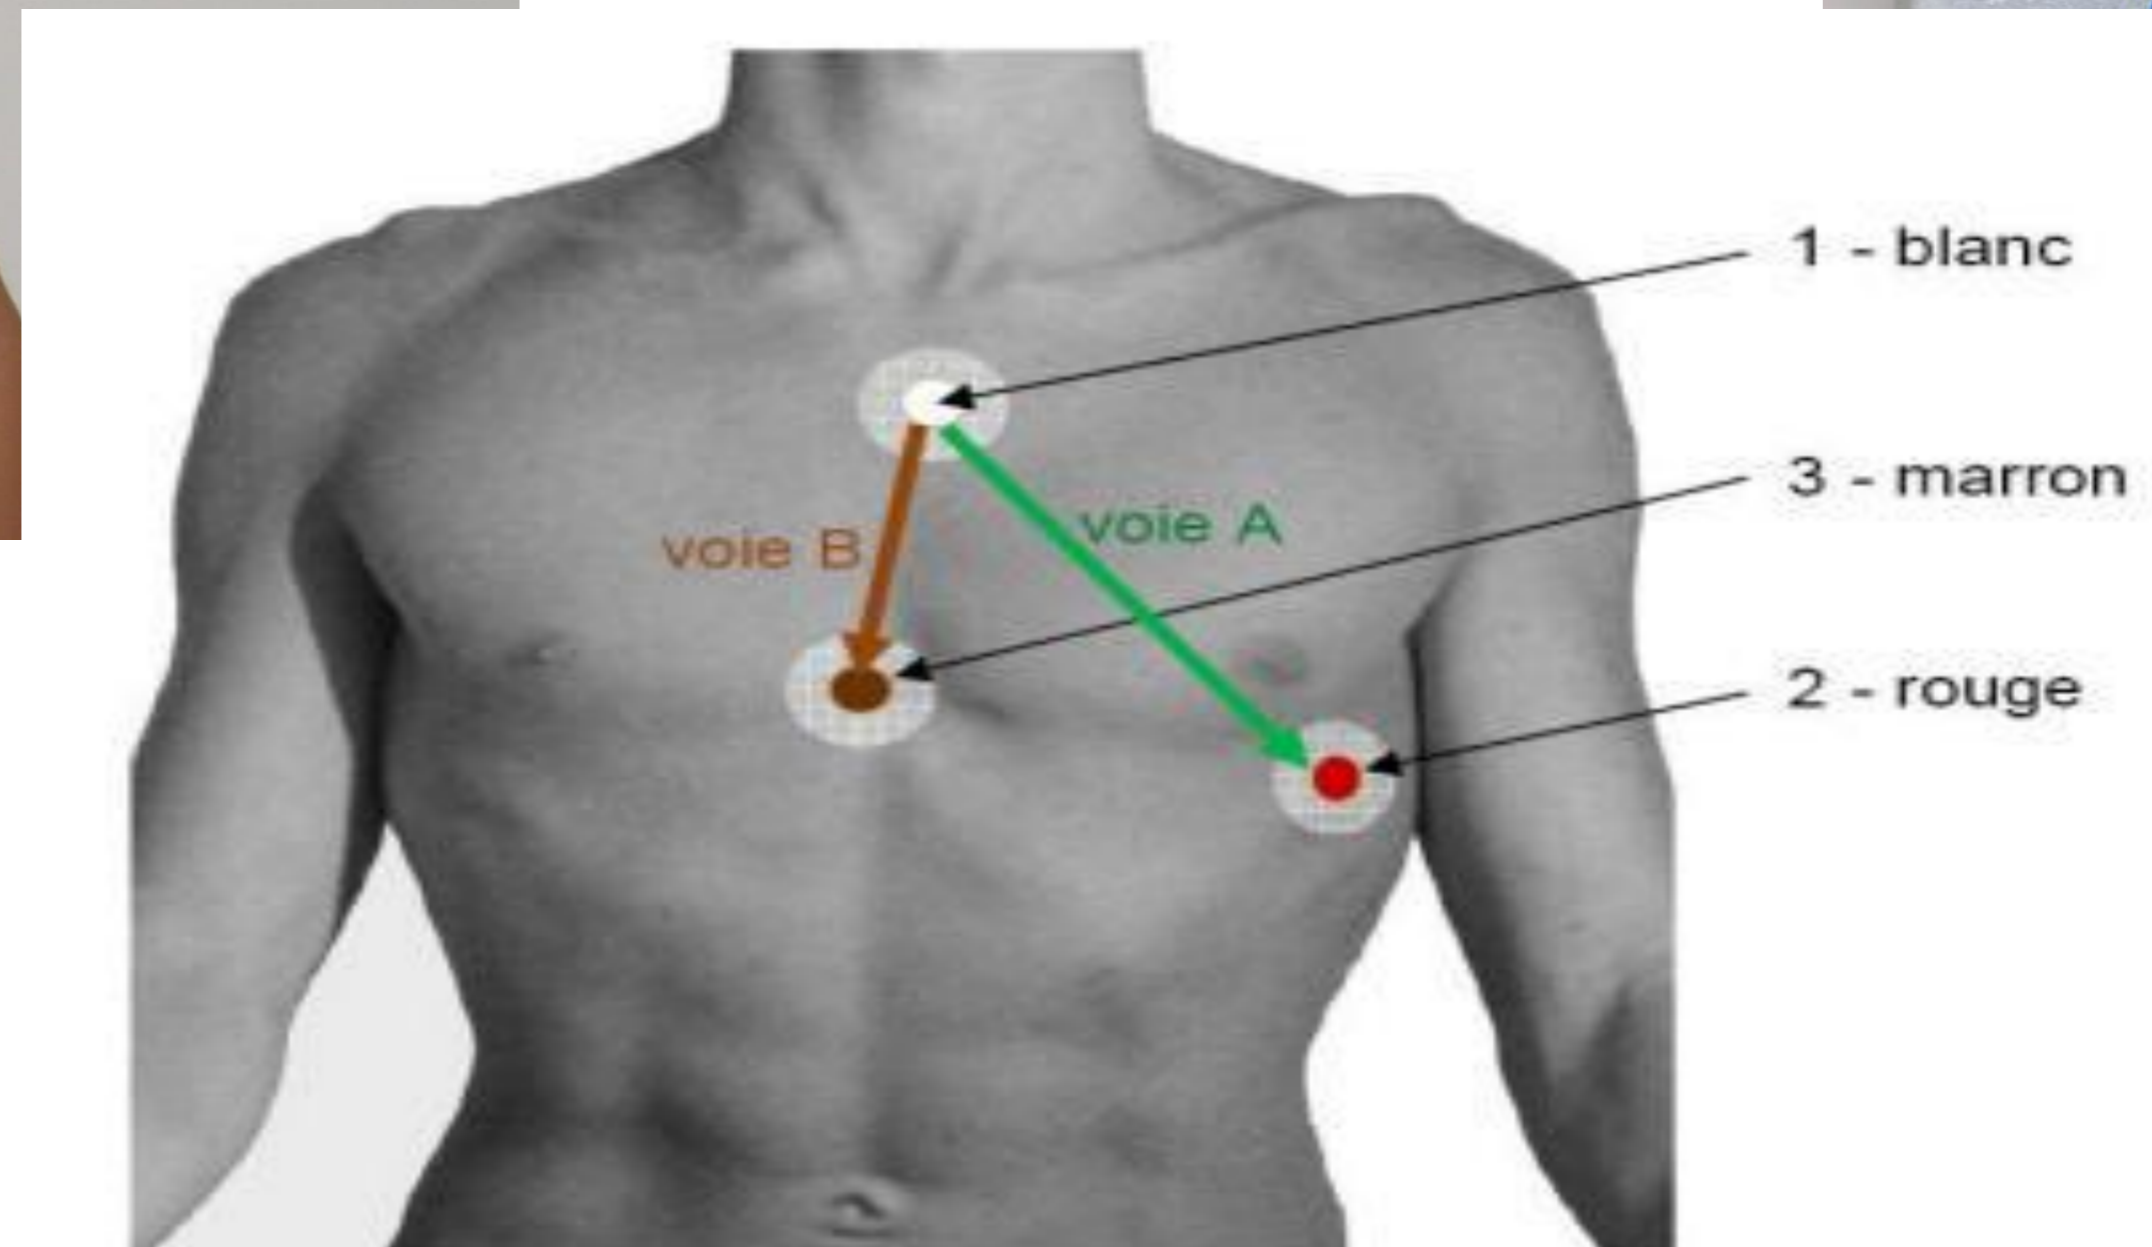

- Enregistrement :
 - jusqu'à 40 jours de tous les intervalles RR avec une pile lithium
 - jusqu'à 15 jours de tous les intervalles RR avec une pile alcaline
 - Jusqu'à 25 heures d'échantillons ECG 2 dérivations
- Durée maximale pré-événement : 7 min 30 s
Durée maximale post-événement : 15 min
- Dynamique d'entrée : ± 16 mV
 - Fréquence d'échantillonnage : 200 Hz

- Résolution : 10 μ V
- Alimentation : 1 pile AAA alcaline ou lithium
- Communication : Modulation audio
- Type de média : Carte mémoire SD 256 Mo ou 1 Go
- Câble ECG :
 - 1 dérivation / 2 brins : RC031
 - 2 dérivations / 3 brins : RC032
- Poids : 50 g sans la pile 64 g avec la pile
- Dimensions : 75 x 50 x 19.5 mm

holter ECG longue durée

AFT 1000:holter 24h à 25j en continu

HOLTER ECG COURTE ET LONGUE DURÉE

quand faire holter ECG

- le plus prêt possible de l'épisode d'AVC
- dans les 72h: FAP= 17,5% par holter ECG 24H

Douen AG. Stroke. 2008; 39: 480-482

enregistrer ECG dans les 72H par holter ECG longue durée ou par scope en continu ds les unités intensives de neurologie

Rizos T. Cerebrovasc Dis 2010; 30: 410-417

Etude personnelle du HLD 21J et AVC
cryptogénique (service CHR Versailles,
prof PICO)

Objectives

- Evaluate the detection rate of paroxysmal atrial fibrillation (PAF) in patients with cryptogenic brain infarct or TIA using 21 days long duration ECG holter
- Determine risk factors of PAF detection

Results

171 patients: 144 Brain infarct (84%); 27 TIA (16%)

- Mean age 63,2 years ; 63 % Men; 40 % of HTN ; 10 % of Diabetes
- NIHSS arrival (BI)= $2,2 \pm 3,6$ (Almost minor stroke)
- Brain imaging : all had CT or Brain MRI.
- 144 patients (84%) with exploitable Brain MRI data
- Cardiovascular Work up :
 - ✓ 100% ECG
 - ✓ 72% 48h telemetry
 - ✓ TTE 100%; TEE: 88%

Results

Detection rate of AF lasting > 30 sec (*Guidelines AHA 2006*)

= 26 patients (15,2 %)

Median delay between HLD initiation
and first PAF episode detected = **7 days**

Mean number of PAF episodes/patient = 1.2 ± 1.1

conclusion

- H24h n est plus le gold standard, ne pas arrêter le bilan cardio si H24h négatif
- HLD 21j est le meilleur moyen de dépister la FAP et c'est non invasif en plus
- Pb: faut bcp d'appareils de HLD car durée de 1 à 3 semaines
- bcp de patience pour l'interprétation (long et bcp artéfacts)
- coût des appareils cher et organisation+++
